

Algorithm (

1. Build adjacency list from given flights.
2. Initialize $\text{dist}[]$ with ∞ and set $\text{dist}[\text{src}] = 0$.
3. Push $\{\text{src}, 0\}$ into queue.
4. For $\text{stops} = 0$ to k :
 - For all nodes at current level:
 - For each neighbor, update cost if smaller and push into queue.
 - Use a temporary array to update distances.
5. If $\text{dist}[\text{dst}] == \infty$, return -1, else return $\text{dist}[\text{dst}]$.
